About me

Junior Python Backend Developer with hands-on experience shipping production-grade RESTful APIs in FastAPI and Flask. 3 internships across backend development and data analytics, applying layered architecture, async I/O patterns, and end-to-end data validation. Comfortable with Docker containerization, CI/CD pipelines, and Microsoft Azure deployments. B.S. in Computer Systems Engineering (May 2026), 90/100 GPA. English B2, native Spanish.

Skills

Backend (Python): FastAPI, Flask, Django, Pydantic, Motor, async/await, RESTful APIs

Databases: MongoDB, PostgreSQL, Microsoft SQL Server, MySQL

DevOps & Cloud: Docker, Git, CI/CD pipelines, Microsoft Azure (App Services), Linux

Architecture & Design: Layered architecture, REST API design, OOP, schema validation

Data & Visualization: Power BI, DAX, Power Query, PowerApps, Matplotlib, Plotly, Selenium, ETL

Additional Languages & Tools: Java (Spring), JavaScript, TypeScript, SQL, React

Methodologies: Agile, Scrum, code review, version control

Certifications

Django Application Development with SQL and Databases — IBM (Oct 2025): Django ORM, models, views, templates, and SQL database integration.

Developing AI Applications with Python and Flask — IBM (May 2025): Flask REST APIs, Watson AI services, and cloud deployment workflows.

Samsung Innovation Campus — AI & Leadership, Samsung Electronics & UDEM (Apr 2025): 150-hour intensive program covering ML, neural networks, and leadership.

Foundations of Agile Project Management — Google (May 2026): Agile principles, Scrum framework, and sprint planning fundamentals.

IBM Python Developer Track (6 courses, 2025): Python for Data Science, Intro to AI, Hands-on Linux, Git & GitHub, Software Engineering, Python Essentials.

Education

B.S. TecNM - Instituto Tecnológico de Veracruz, B.S. in Computer Systems Engineering – Aug 2021 – May 2026
Veracruz, Mexico

- GPA: 90/100. Member of the Competitive Programming Club (CPC).

Experience

TenarisTamsa, Data Analyst Intern – Veracruz, Mexico Feb 2026 – present

- Save ~1 hr/day of manual processing by engineering automated ETL pipelines that ingest data from 5+ heterogeneous sources (CSV, XML, Access, Excel, PostgreSQL, SQL Server) with Python, freeing analysts to focus on insights instead of data prep.
- Reduced a recurring 30-minute manual download task to ~10 seconds (~180x faster) by building Selenium-based web scrapers that auto-refresh CSV datasets feeding business dashboards, packaged as standalone .exe binaries via PyInstaller and deployed on a scheduled VM with file-based execution logging (run timestamps, downloaded files, durations) for production troubleshooting.
- Co-built a PowerApps + PowerFX application that centralized tube-defect lifecycle management into a single system, owning the architecture and core features, replacing a fragmented Excel + email workflow and cutting handoff delays for the operations team.

- Shipped a production-grade FastAPI + MongoDB RESTful API for SAT fiscal-catalog management, applying layered architecture (routers / services / repositories) and async I/O via Motor to support core tax-compliance workflows.
- Slashed catalog onboarding from hours to seconds by engineering Excel-to-JSON ingestion endpoints with Pydantic schema validation, preventing malformed records from reaching production and ensuring end-to-end data integrity.
- Standardized catalog ingestion across the team by authoring a reusable bulk-conversion script that became the default onboarding pipeline for new SAT catalogs.

Projects

Lnap — Educational Programming Tools – Veracruz, Mexico

- Built an interactive Flask-based visualization platform that explains programming structures across multiple languages, adopted in active classroom sessions and validated by 80+ first-semester students through structured feedback surveys.
- Developed a pseudocode-to-Python translator in Flask + Python under an institutional research contract, helping students bridge algorithmic thinking and formal syntax during live class sessions.

HealthMed Chat — Medical Diagnosis API – Veracruz, Mexico

- Designed a Flask REST API that returns a ranked Top-5 diagnosis list from patient inputs (age, gender, BMI, symptoms) via a two-stage inference engine — rule-based filtering followed by KNN scoring with confidence values.
- Instrumented structured session logging of inputs, outputs, and latency metrics to enable post-hoc accuracy evaluation and model performance analysis.
